Elmasri, Navathe, 5th ed., Addison Wesley

# SQL (Structured Query Language )

- History:
  - SQL1, @1989
  - SQL2=SQL92 (*create schema, referential integrity options and additional data types (s.a. DATE, TIME, and TIMESTAMP) are added..*)
  - SQL3=SQL99 (*object-relational database concepts, call level interfaces, and integrity management* )
- SQL is based on
  - Relational algebra:
    - introduced by E. F. Codd in 1972,
    - Provide the basic concepts behind computing SQL syntax.
    - It is a procedural way to construct data-driven queries
    - it addresses the **how** logic of a structured query.
- Additionally SQL provides
  - insertion, modification and deletion.
  - Arithmetic operators
  - Display of data
  - Assignment
  - Aggregate functions

# SQL: Data Definition, Constraints, and Schema Changes

- Used to CREATE, DROP, and ALTER the descriptions of the tables (relations) of a database
- Specifies a new base relation by giving it a name, and specifying each of its attributes and their data types (INTEGER, FLOAT, DECIMAL(i,j), CHAR(n), VARCHAR(n))
- Specifying constraints
  - NOT NULL may be specified on an attribute
  - Key attributes can be specified via the PRIMARY KEY and UNIQUE phrases
  - referential integrity constraints (foreign keys).

```
CREATE TABLE DEPT (  
  DNAME    VARCHAR(10)  NOT NULL,  
  DNUMBER  INTEGER      NOT NULL,  
  MGRSSN   CHAR(9)      DEFAULT '000',  
  MGRSTARTDATE CHAR(9),  
  PRIMARY KEY (DNUMBER),  
  UNIQUE (DNAME),  
  FOREIGN KEY (MGRSSN) REFERENCES EMP  
    ON DELETE SET DEFAULT  
    ON UPDATE CASCADE);
```

```
CREATE TABLE EMP(  
  ENAME     VARCHAR(30) NOT NULL,  
  ESSN      CHAR(9),  
  BDATE     DATE,  
  DNO       INTEGER  DEFAULT 1,  
  SUPERSSEN CHAR(9),  
  PRIMARY KEY (ESSN),  
  FOREIGN KEY (DNO) REFERENCES DEPT ON  
  DELETE SET DEFAULT ON UPDATE CASCADE,  
  FOREIGN KEY (SUPERSSEN) REFERENCES EMP  
  ON DELETE SET NULL ON UPDATE CASCADE);
```

# cont.

- **Integrity Constraints in Create Table**
  - not null
  - **primary key**( $A_1, \dots, A_n$ )
  - **foreign key** ( $A_m, \dots, A_n$ )  
references  $r$
- **primary key** declaration on an attribute automatically ensures **not null**
- Some foreign keys may cause errors
  - Specified either via:
    - Circular references, or
    - they refer to a table that has not yet been created.  
(Discussed previously in *relationl model constraints*)

```
CREATE TABLE DEPT_LOCATIONS
( Dnumber          INT          NOT NULL,
  Dlocation        VARCHAR(15)  NOT NULL,
  PRIMARY KEY (Dnumber, Dlocation),
  FOREIGN KEY (Dnumber) REFERENCES DEPARTMENT(Dnumber) );

CREATE TABLE PROJECT
( Pname           VARCHAR(15)    NOT NULL,
  Pnumber         INT            NOT NULL,
  Plocation       VARCHAR(15),
  Dnum            INT            NOT NULL,
  PRIMARY KEY (Pnumber),
  UNIQUE (Pname),
  FOREIGN KEY (Dnum) REFERENCES DEPARTMENT(Dnumber) );

CREATE TABLE WORKS_ON
( Essn            CHAR(9)        NOT NULL,
  Pno             INT            NOT NULL,
  Hours           DECIMAL(3,1)   NOT NULL,
  PRIMARY KEY (Essn, Pno),
  FOREIGN KEY (Essn) REFERENCES EMPLOYEE(Ssn),
  FOREIGN KEY (Pno) REFERENCES PROJECT(Pnumber) );

CREATE TABLE DEPENDENT
( Essn            CHAR(9)        NOT NULL,
  Dependent_name  VARCHAR(15)    NOT NULL,
  Sex             CHAR,
  Bdate          DATE,
  Relationship     VARCHAR(8),
  PRIMARY KEY (Essn, Dependent_name),
  FOREIGN KEY (Essn) REFERENCES EMPLOYEE(Ssn) );
```

## cont. (more detailed create command)

```
CREATE TABLE EMPLOYEE
(
    ...,
    Dno          INT          NOT NULL          DEFAULT 1,
    CONSTRAINT EMPPK
        PRIMARY KEY (Ssn),
    CONSTRAINT EMPSUPERFK
        FOREIGN KEY (Super_ssn) REFERENCES EMPLOYEE(Ssn)
            ON DELETE SET NULL          ON UPDATE CASCADE,
    CONSTRAINT EMPDEPTFK
        FOREIGN KEY(Dno) REFERENCES DEPARTMENT(Dnumber)
            ON DELETE SET DEFAULT       ON UPDATE CASCADE);

CREATE TABLE DEPARTMENT
(
    ...,
    Mgr_ssn      CHAR(9)      NOT NULL          DEFAULT '888665555',
    ...,
    CONSTRAINT DEPTPK
        PRIMARY KEY(Dnumber),
    CONSTRAINT DEPTSK
        UNIQUE (Dname),
    CONSTRAINT DEPTMGRFK
        FOREIGN KEY (Mgr_ssn) REFERENCES EMPLOYEE(Ssn)
            ON DELETE SET DEFAULT       ON UPDATE CASCADE);

CREATE TABLE DEPT_LOCATIONS
(
    ...,
    PRIMARY KEY (Dnumber, Dlocation),
    FOREIGN KEY (Dnumber) REFERENCES DEPARTMENT(Dnumber)
        ON DELETE CASCADE              ON UPDATE CASCADE);
```

**Figure 4.2**

Example illustrating how default attribute values and referential integrity triggered actions are specified in SQL.

# DROP TABLE / ALTER TABLE

- DROP TABLE

- Used to remove a relation (base table) and its definition
- The relation can no longer be used in queries, updates, or any other commands since its description no longer exists
- Example: **DROP TABLE DEPENDENT;**

- ALTER TABLE

- Used to add an attribute to one of the base relations
  - The new attribute will have NULLs in all the tuples of the relation right after the command is executed; hence, the NOT NULL constraint is not allowed for such an attribute
- Example:  
**ALTER TABLE EMPLOYEE ADD JOB VARCHAR(12);**
- The database users must still enter a value for the new attribute JOB for each EMPLOYEE tuple.
  - This can be done using the UPDATE command.

# Retrieval Queries in SQL

- SQL has one basic statement for retrieving information from a database; the **SELECT** statement
  - This is *not the same* as the SELECT operation of the relational algebra
- Important distinction between SQL and the formal relational model:
  - SQL allows a table (relation) to have two or more tuples that are identical in all their attribute values
  - Hence, an SQL relation (table) is a **multi-set** (sometimes called a **bag**) of tuples; it is *not* a set of tuples. Example: {A, B, C, A} is a bag. {A, B, C} is also a bag that also is a set. Bags also resemble lists, but the order is irrelevant in a bag.
- SQL relations can be constrained to be sets by specifying PRIMARY KEY or UNIQUE attributes, or by using the DISTINCT option in a query

# SQL Types: numeric, string, date

Type Name	Flavor	Precision	Scale	Sample Constant
NUMERIC(5,3)	exact	5 digits	3	31.416
INTEGER or INT	exact	9 digits	0	314159265
SMALLINT	exact	4 digits	0	3142
FLOAT(3)	approximate	3 bits	--	3.5
FLOAT	approximate	24 bits	--	3.1415926
DOUBLE PRECISION	approximate	53 bits	--	3.141592653589793

**Figure 4-14**  
Numeric types in SQL

*VARCHAR(100)*

2 byte  
[|||||]

VARCHAR(n), CHAR(n)

DATE '2008-07-03' = 3 July, 2008

INTERVAL '5' DAY

Function Name	Meaning	Example Usage	Result
<i>current_date</i>	Return the current date.	<i>current_date</i>	Today's date
<i>extract</i>	Extract the year, month, or day from a date.	<i>extract</i> (month, date '2008-07-04')	7
+	Add an interval to a date.	date '2008-07-04' + interval '7' month	date '2009-02-04'
-	Subtract an interval from a date or subtract two dates.	date '2008-07-04' - date '2008-06-30'	interval '5' day

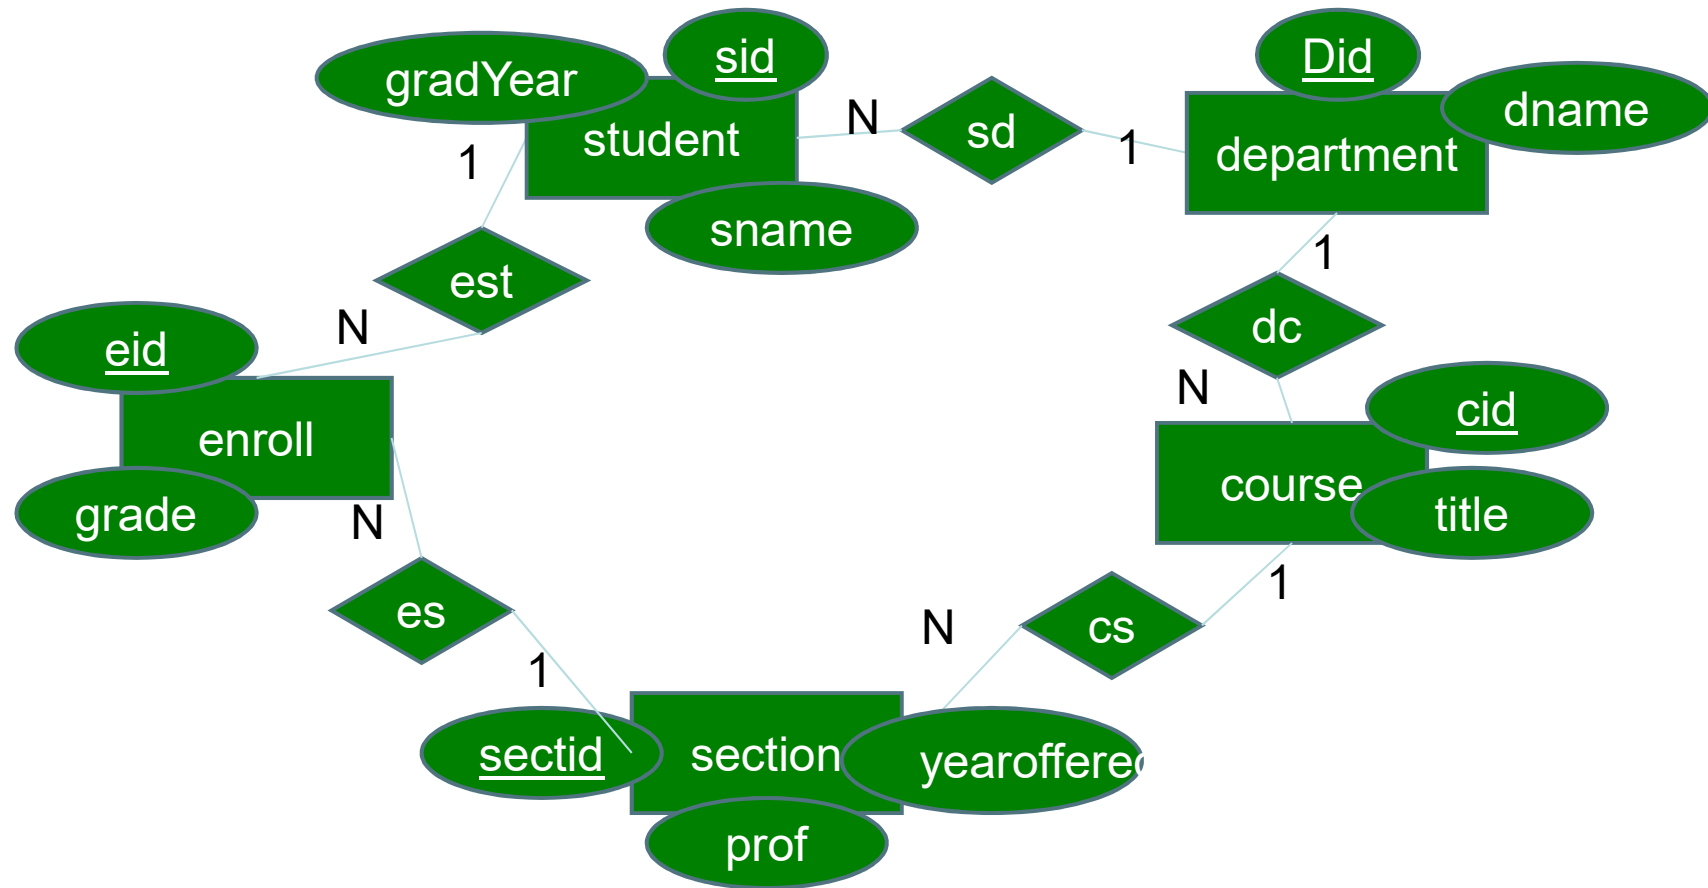

**Figure 4-16**  
Some common SQL date/interval functions

Function Name	Meaning	Example Usage	Result
<i>lower</i> (also, <i>upper</i> )	Turn the characters of the string into lower case (or upper case).	<i>lower</i> ('Einstein')	'einstein'
<i>trim</i>	Remove leading and trailing spaces.	<i>trim</i> (' Einstein ')	'Einstein'
<i>char_length</i>	Return the number of characters in the string.	<i>char_length</i> ('Einstein')	8
<i>substring</i>	Extract a specified substring.	<i>substring</i> ('Einstein' from 2 for 3)	'ins'
<i>current_user</i>	Return the name of the current user.	<i>current_user</i>	'einstein' (assuming that he is currently logged in)
	Catenate two strings.	'A. '    'Einstein'	'A. Einstein'
<i>like</i>	Match a string against a pattern.	'Einstein' <i>like</i> '_i%i_ %'	true

**Figure 4-15**  
Some common SQL string functions

# A student record database:

```
STUDENT(SId, SName, GradYear, MajorId)
DEPT(DId, DName)
COURSE(CId, Title, DeptId)
SECTION(SectId, CourseId, Prof, YearOffered)
ENROLL(EId, StudentId, SectionId, Grade)
```

	Student #6	kim	2000
	Student #7	art	2000
	Student #8	pat	2000
	Student #9	lee	2000

- Calculate the number of years since graduation for each student
  - Q69: select s.\*, extract(YEAR,current\_date)-s.GradYear AS AlumYears  
from STUDENT s;
- Determine if a student has graduated
  - Q71: select q.\*, if(q.AlumYrs>0,'alum', 'in school') AS GradStats  
from Q69 q;

# from

STUDENT(SId, SName, GradYear, MajorId)  
DEPT(DId, DName)  
COURSE(CId, Title, DeptId)  
SECTION(SectId, CourseId, Prof, YearOffered)  
ENROLL(EId, StudentId, SectionId, Grade)

- All combinations of STUDENT and DEPT records..

- Q73: select s.\*,d.\*  
from STUDENT s,DEPT d

DEPT	DId	DName
	10	compsci
	20	math
	30	drama

- All pairs of STUDENT names

- Q74: select s1.SNAME as name1, s2.SName as name2  
from STUDENT s1, STUDENT s2

- The join of STUDENT and DEPT

- Q75: select s.SName, d.DName  
from STUDENT s join DEPT d ON s.MajorId=
  - Outer join lists all records even it has no match.

STUDENT	SId	SName	GradYear	MajorId
	1	joe	2004	10
	2	amy	2004	20
	3	max	2005	10
	4	sue	2005	20
	5	bob	2003	30
	6	kim	2001	20
	7	art	2004	30
	8	pat	2001	20
	9	lee	2004	10

- select s.SName, d.DName

- from STUDENT s full join DEPT d ON s.MajorId=d.DId

- The names of students and their professors

- Q76: select s.SName, k.Prof  
from (STUDENT s join ENROLL e ON s.SId=e.StudentId) join  
SECTION k on e.SectionId = k.SectId

# where

STUDENT(SId, SName, GradYear, MajorId)  
DEPT(DId, DName)  
COURSE(CId, Title, DeptId)  
SECTION(SectId, CourseId, Prof, YearOffered)  
ENROLL(EId, StudentId, SectionId, Grade)

- **The names of students graduating in 2005 or 2006.**
  - Q77: Select s.SName  
From STUDENT s  
Where (s.GradYear=2005) or (s.GradYear=2006)
- **The names of students and their professors (compare with Q76)**
  - Q78: select s.SName, k.Prof  
from STUDENT s, ENROLL e, SECTION k  
where s.SId=e.StudentId and e.SectionId = k.SectId
- **Find the grades Joe received during his graduation year. (remember Q29)**
  - Q79: select e.Grade  
from STUDENT s, ENROLL e, SECTION k  
where s.SId=e.StudentId and e.SectionId = k.SectId and  
k.YearOffered=s.GradYear and s.SName='Joe';
- **The students whose names begin with 'j' and graduate this year**
  - Q80: select s.\*  
from STUDENT s  
where s.SName like 'j%' and s.GradYear=extract(YEAR,current\_date)
- **Grades given by the current professor-user**
  - Q81: select s.SName, e.Grade  
from STUDENT s, ENROLL e, SECTION k  
where s.SId=e.StudentId and e.SectionId = k.SectId and  
k.Prof=current\_user;

x = y  
^ ^ ^  
^ ^ ^  
^ ^ ^  
^ ^ ^

# groupby

```
STUDENT(SId, SName, GradYear, MajorId)
DEPT(DId, DName)
COURSE(CId, Title, DeptId)
SECTION(SectId, CourseId, Prof, YearOffered)
ENROLL(EId, StudentId, SectionId, Grade)
```

1. Grouping fields are in group by clause. Aggregate functions are in select clause
  2. The order of execution:  
FROM → WHERE → GROUP BY → SELECT
  3. The only non-computed fields allowed in the select are grouping fields.
  4. Thus; empty group by clause AND select clause with aggregate function can only show the result of aggregate function.
- **The minimum and maximum graduation year per major (remember Q12)**
    - Q82: select s.MajorId, min (GradYear), max (GradYear)  
from STUDENT s  
group by s.MajorId
  - **Find the section that gave out the most 'A' grades. (remember Q18-20)**

*select s, max(grade)  
from student*

Q83: select e.SectionId, count (EId) AS numAs  
from ENROLL e  
where e.Grade='A'  
group by e.SectionId

illegal

**The maximum number of A's given in any section:**

Q84: select max (q.numAs) AS maxAs  
from Q83 q

**Find the section that gave out the most 'A' grades.**

Q85: select Q83.SectionId  
from Q83, Q84  
where Q83.numAs=Q84.maxAs

**Find the section that gave out the most 'A' grades**

Q84a: select q.SectionId, max (q.numAs) as maxAs  
from Q83 q

**Find the section that gave out the most 'A' grades.**

Q84b: select q.SectionId  
from Q83 q  
where q.numAs=max (q.numAs)

14

*select q, max(grade)  
from student*

# group by

```
STUDENT(SId, SName, GradYear, MajorId)
DEPT(DId, DName)
COURSE(CId, Title, DeptId)
SECTION(SectId, CourseId, Prof, YearOffered)
ENROLL(EId, StudentId, SectionId, Grade)
```

- Show the name of each student and the number of courses they took.

- Q86: select e.StudentId, count (EId) AS HowMany  
from ENROLL e  
group by e.StudentId

Q87: select s.SName,q.HowMany  
from Q86 q, STUDENT s  
where q.StudentId=s.StudentId

- Q87 is technically correct. But does not show students that have not yet taken any course.

Thus, we need outerjoin:

Q87a: select s.SName,q.HowMany  
from STUDENT s **full join** Q86 q ON q.StudentId=s.~~SId~~StudentId

- Q87a is technically correct. But does not show 0 number of course for students that have not yet taken any course. It shows NULL. Thus, we do outerjoin before counting.

Q88: select e.SName, count (EId) AS HowMany  
from STUDENT s **full join** ENROLL e ON s.SId=e.StudentId  
group by s.SName

- Q88 is technically correct. But it groups records by student name in order to show it in the output. In case of any student having the same name, the result will be erroneous.

Q89: select e.SName, count (e.EId) AS HowMany  
from STUDENT s **full join** ENROLL e ON s.SId=e.StudentId  
group by s.SId, s.SName // has no difference with group by s.SId

STUDENT(SId, SName, GradYear, MajorId)  
DEPT(DId, DName)  
COURSE(CId, Title, DeptId)  
SECTION(SectId, CourseId, Prof, YearOffered)  
ENROLL(EId, StudentId, SectionId, Grade)

## group by

- List of all major department names of students graduated in 2004, with no duplicates.
  - Q90: select d.DName  
from STUDENT s, DEPT d  
where s.MajorId = d.DId and s.GradYear=2004  
group by d.DName // used to remove duplicates!
  - //alternate version of Q90  
Q91: select distinct d.DName  
from STUDENT s, DEPT d  
where s.MajorId = d.DId and s.GradYear=2004
- Show the number of different majors that students have taken.
  - Q92: select count (distinct s.MajorId)  
from STUDENT s

# having

STUDENT(SId, SName, GradYear, MajorId)  
DEPT(DId, DName)  
COURSE(CId, Title, DeptId)  
SECTION(SectId, CourseId, Prof, YearOffered)  
ENROLL(EId, StudentId, SectionId, Grade)

- List professors who taught more than 4 sections in 2008.

- Q93: select k.Prof, count(k.SectId) as howMany  
from SECTION k  
where k.YearOffered=2008 and howMany>4  
group by k.Prof

illegal

- Q94: select k.Prof, count(k.SectId) as howMany  
from SECTION k  
where k.YearOffered=2008  
group by k.Prof

Q95: select q.Prof, q.howMany  
from Q94 q  
where q.howMany>4

- Q96: select k.Prof, count(k.SectId) as howMany  
from SECTION k  
where k.YearOffered=2008  
group by k.Prof  
having count(k.SectId)>4

- The order of execution:

FROM → WHERE → GROUP BY → HAVING → SELECT

# Nested queries

```
STUDENT(SId, SName, GradYear, MajorId)
DEPT(DId, DName)
COURSE(CId, Title, DeptId)
SECTION(SectId, CourseId, Prof, YearOffered)
ENROLL(EId, StudentId, SectionId, Grade)
```

- Nested queries is used to express semijoin and antijoin.
- $(T1 \bowtie_{A=B} T2) \equiv \text{select } * \text{ from } T1 \text{ where } A \text{ IN (select B from } T2)$
- $(T1 \blacktriangleright_{A=B} T2) \equiv \text{select } * \text{ from } T1 \text{ where } A \text{ NOT IN (select B from } T2)$
- Determine the departments having at least one major (remember Q35)
  - Q97: 

```
select d.*
from DEPT d
where d.DId IN (select s.MajorId
                from STUDENT s )
```
- Determine those students who took a course with Prof. Einstein. (remember Q38-40)
  - Q98: 

```
select s.*
from STUDENT s
where s.SId IN
      (select e.StudentId
       from ENROLL e
       where e.SectionId IN
            (select k.SectId
             from SECTION k
             where k.Prof='einstein'))
```

# Nested queries:

STUDENT(SId, SName, GradYear, MajorId)  
DEPT(DId, DName)  
COURSE(CId, Title, DeptId)  
SECTION(SectId, CourseId, Prof, YearOffered)  
ENROLL(EId, StudentId, SectionId, Grade)

- List the sections where <sup>"</sup>nobody<sup>"</sup> received an 'F'.  
(remember Q42-43)

- Q99: select  
from SECTION k  
where k.SectId NOT IN  
(select e.SectionId  
from ENROLL e  
where e.Grade = 'F')

## union:

- Combined names of students and professors (remember Q54)
  - Q100: select s.SName as Person from STUDENT s  
union  
select k.Prof as Person from SECTION k

# order by

```
STUDENT(SId, SName, GradYear, MajorId)
DEPT(DId, DName)
COURSE(CId, Title, DeptId)
SECTION(SectId, CourseId, Prof, YearOffered)
ENROLL(EId, StudentId, SectionId, Grade)
```

- The order of execution:  
FROM → WHERE → GROUP BY → HAVING → SELECT → UNION → ORDER BY
- The number of math majors per graduation year sorted by count descending and then year.
  - Q101: select s.GradYear, count(SId) as howMany  
from STUDENT s  
group by s.GradYear  
order by howMany DESC, s.GradYear
- The combined names of students and professors in sorted order  
(Sorted version of Q100)
  - Q100: select s.SName as Person from STUDENT s  
union  
select k.Prof as Person from SECTION k  
order by Person

# SQL update

```
STUDENT(SId, SName, GradYear, MajorId)
DEPT(DId, DName)
COURSE(CId, Title, DeptId)
SECTION(SectId, CourseId, Prof, YearOffered)
ENROLL(EId, StudentId, SectionId, Grade)
```

1. insert 1 new record by giving its values
  2. insert multiple new record by specifying a query
  3. Delete records
  4. Modify the contents of records
- insert into STUDENT (SId,SName,MajorId,GradYear)  
values (10, 'ron', 30, 2009)
  - create table ALUMNI(SId int,SName varchar(10),Major varchar(8),GradYear int)  
insert into ALUMNI (SId, SName, Major, GradYear)  
select s.SId , s.SName, d.DName , s.GradYear  
from STUDENT s, DEPT d  
where s.MajorId = d.DId and s.GradYear<extract (YEAR, current\_date)
  - insert into STUDENT (SId , SName, Major , GradYear )  
select 22 AS SId , 'jon' AS SName, s.MajorId , s.GradYear  
from STUDENT s  
where s.SId=1
1. delete from SECTION where SectID NOT IN (select e.SectionId from ENROLL e)
  2. delete from SECTION
- update STUDENT set MajorId=10, GradYear=GradYear+1 where MajorId=20

# COMPANY Database Schema and state--Figure 5.5 (from Elmasri/Navathe)

All following examples use the COMPANY database

## Sample Queries on COMPANY

(Query numbers are according to textbook)

- Query 14: Retrieve the names of all employees who do not have supervisors.
  - Q14: 

```
SELECT FNAME, LNAME
FROM EMPLOYEE
WHERE SUPERSSN IS NULL
```
- Query 25: Retrieve all employees whose address is in Houston, Texas. Here, the value of the ADDRESS attribute must contain the substring 'Houston,TX' in it.
  - Q25: 

```
SELECT FNAME, LNAME
FROM EMPLOYEE
WHERE ADDRESS LIKE '%Houston,TX%'
```
- Query 26: Retrieve all employees who were born during the 1950s.
  - Here, '5' must be the 8th character of the string (according to our format for date),
  - Q26: 

```
SELECT FNAME, LNAME
FROM EMPLOYEE
WHERE BDATE LIKE '____5_'
```

## Sample Queries on COMPANY

- Query 1: Retrieve the name and address of all employees who work for the 'Research' department.

```
Q1: SELECT  FNAME, LNAME, ADDRESS
      FROM    EMPLOYEE
      WHERE   DNO IN (SELECT DNUMBER
                      FROM    DEPARTMENT
                      WHERE DNAME='Research' )
```

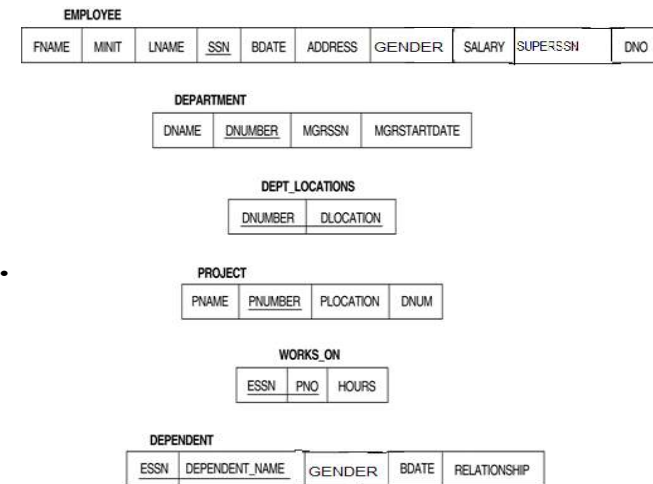

- If a condition in the WHERE-clause of a *nested query* references an attribute of a relation declared in the *outer query*, the two queries are said to be **correlated**
  - The result of a correlated nested query is different for each tuple (or combination of tuples) of the relation(s) of the outer query

- Query 12: Retrieve the name of each employee who has a dependent with the same first name as the employee.

```
Q12: SELECT  E.FNAME, E.LNAME
      FROM    EMPLOYEE AS E
      WHERE   E.SSN IN
              (SELECT ESSN
               FROM    DEPENDENT
               WHERE ESSN=E.SSN AND
                     E.FNAME=DEPENDENT_NAME)
```

A query written with nested SELECT... FROM... WHERE... blocks and using **the = or IN** comparison operators can **always** be expressed as a single block query.

```
Q12A:      SELECT E.FNAME, E.LNAME
            FROM    EMPLOYEE E, DEPENDENT D
            WHERE   E.SSN=D.ESSN AND
                    E.FNAME=D.DEPENDENT_NAME
```

EMPLOYEE									
FNAME	MINIT	LNAME	SSN	BDATE	ADDRESS	GENDER	SALARY	SUPERSSN	DNO

## Sample Queries on COMPANY

- Query 12: Retrieve the name of each employee who has a dependent with the same first name as the employee.

Q12B:       SELECT FNAME, LNAME  
               FROM   EMPLOYEE  
               WHERE EXISTS (SELECT                       \*  
   FROM               DEPENDENT  
   WHERE               SSN=ESSN AND  
    FNAME=DEPENDENT\_NAME)

- Query 6: Retrieve the names of employees who have no dependents.

Q6:   SELECT FNAME, LNAME  
       FROM   EMPLOYEE  
       WHERE NOT EXISTS (SELECT \*  
   FROM               DEPENDENT  
   WHERE               SSN=ESSN)

## Sample Queries on COMPANY

- Query 3: Retrieve the name of each employee who works all the projects on controlled by department number 5.

Q3 (rephrase) select each employee s.t. there does not exist a project controlled by dept.#5 that the employee that the employee does not work on.

```
SELECT FNAME, LNAME
FROM EMPLOYEE
WHERE NOT EXIST
  (SELECT *
   FROM WORKS_ON B
   WHERE (B.PNO IN (SELECT PNUMBER
                     FROM PROJECT
                     WHERE DNUM=5)))
```

Q1 =  $\Pi_{ESSN, PNO}$  (works on)  
 Q2 =  $Q1 \div R1$   
 result = R1  $\Delta$  Employee  
 $\Delta ESSN = ESSN$

AND  
 NOT EXIST (SELECT \*  
 FROM WORKS\_ON C  
 WHERE  $SSN=C.ESSN$  and  
 $C.PNO=B.PNO$ );

Q1 =  $\Pi_{ESSN, PNO}$  PROJECT  
 $PNUMBER=5$

FNAME	MINIT	LNAME	SSN	BDATE	ADDRESS	GENDER	SALARY	SUPERSSN	DNO
-------	-------	-------	-----	-------	---------	--------	--------	----------	-----

DEPARTMENT			
DNAME	DNUMBER	MGRSSN	MGRSTARTDATE

DEPT_LOCATIONS	
DNUMBER	DLOCATION

PROJECT			
PNAME	PNUMBER	PLOCATION	DNUM

WORKS_ON		
ESSN	PNO	HOURS

DEPENDENT				
ESSN	DEPENDENT_NAME	GENDER	BDATE	RELATIONSHIP

- Query 7: List the names of managers who have at least one dependent.

Q7:   
 SELECT FNAME, LNAME  
 FROM EMPLOYEE  
 WHERE EXIST (SELECT \*  
 FROM DEPENDENT  
 WHERE SSN=ESSN)  
 AND  
 EXIST (SELECT \*  
 FROM DEPARTMENT  
 WHERE SSN=MGRSSN)

Rewrite this query using only a single nested query or no nested query.

Query 22: For each project on which more than two employees work, retrieve the project number, project name, and the number of employees who work on that project.

Q22:   
 SELECT PNUMBER, PNAME, COUNT(\*)  
 FROM PROJECT, WORKS\_ON  
 WHERE PNUMBER=PNO  
 GROUP BY PNUMBER, PNAME  
 HAVING COUNT (\*) > 2

## Updates in COMPANY DB

- Change the location and controlling department number of project number 10 to 'Bellaire' and 5, respectively.

```
U5:      UPDATE      PROJECT
          SET    PLOCATION = 'Bellaire',
                DNUM = 5
          WHERE    PNUMBER=10
```

- Give all employees in the 'Research' department a 10% raise in salary.

```
U6:      UPDATE EMPLOYEE
          SET SALARY = SALARY *1.1
          WHERE DNO IN (SELECT      DNUMBER
                           FROM      DEPARTMENT
                           WHERE      DNAME='Research')
```

# Summary of SQL Queries

- A query in SQL can consist of up to six clauses, but only the first two, SELECT and FROM, are mandatory. The clauses are specified in the following order:

SELECT	<attribute list>
FROM	<table list>
[WHERE	<condition>]
[GROUP BY	<grouping attribute(s)>]
[HAVING	<group condition>]
[ORDER BY	<attribute list>]

- The SELECT-clause lists the attributes or functions to be retrieved
- The FROM-clause specifies all relations (or aliases) needed in the query but not those needed in nested queries
- The WHERE-clause specifies the conditions for selection and join of tuples from the relations specified in the FROM-clause
- GROUP BY specifies grouping attributes
- HAVING specifies a condition for selection of groups
- The order of execution:

FROM → WHERE → GROUP BY → HAVING → SELECT → UNION → ORDER BY

# SQL views

- **Regular View:**
  - named query
  - Store only definition, real data is not stored...
  - Used to hold subqueries for convenience AND logical data independence.
- Another type of View : **Materilized View**
  - Involves physically creating and keeping a temporary table
  - Disadvantage : Maintaining correspondence between the base table and the view when the base table is updated

## • Ex. on Student DB:

```
create view Q65 as
select s.SName, s.GradYear
from STUDENT s
select q.SName
from Q65 q
where q.GradYear=2004
```

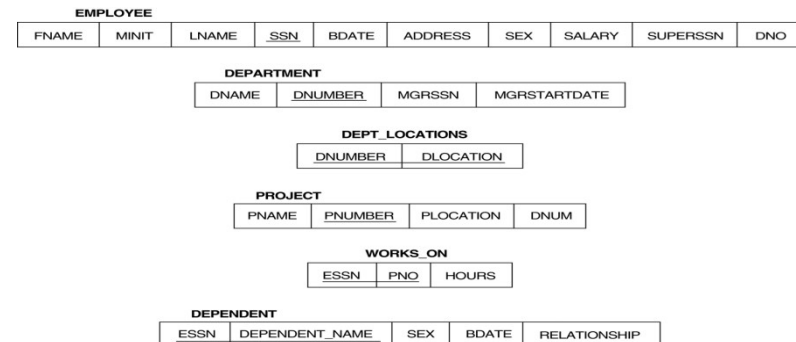

```
STUDENT(SId, SName, GradYear, MajorId)
DEPT(DId, DName)
COURSE(CId, Title, DeptId)
SECTION(SectId, CourseId, Prof, YearOffered)
ENROLL(EId, StudentId, SectionId, Grade)
```

## • Ex. on Student DB:

CREATE VIEW **WORKS\_ON\_NEW** AS

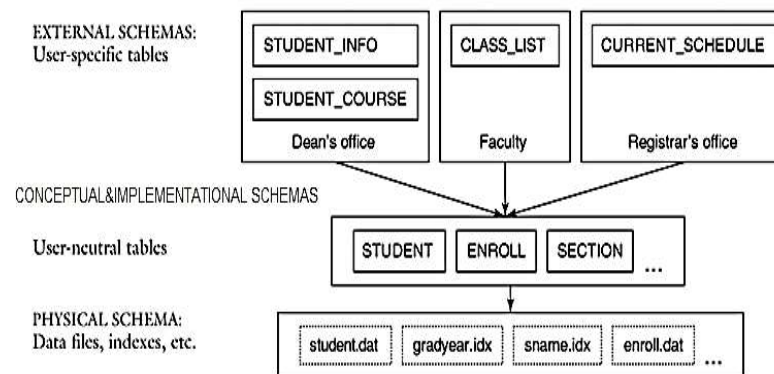

```
SELECT FNAME, LNAME, PNAME, HOURS
FROM EMPLOYEE, PROJECT, WORKS_ON
WHERE SSN=ESSN AND PNO=PNUMBER
```

```
SELECT FNAME, LNAME FROM WORKS_ON_NEW WHERE PNAME='Seena';
DROP WORKS_ON_NEW;
```

# View usage for logical data independence

- Views are used for logical data independence.
- External schema consists of views.

```
STUDENT(SId, SName, GradYear, MajorId)
DEPT(DId, DName)
COURSE(CId, Title, DeptId)
SECTION(SectId, CourseId, Prof, YearOffered)
ENROLL(EId, StudentId, SectionId, Grade)
```

- **STUDENT\_INFO** (SId, SName, GPA, NumCoursesPassed, NumCoursesFailed)
- **STUDENT\_COURSES** (SId, YearOffered, Title, Prof, Grade)
- create view **STUDENT\_COURSES** as  
    select e.StudentId as SId, k.YearOffered, c.Title,  
        k.Prof, e.Grade  
    from ENROLL e, SECTION k, COURSE c  
    where e.SectionId=k.SectId and k.CourseId=c.CId

# Regular View Updates

- The records in the view do not really exist, they are computed from other records in db.
- If every record  $r$  has a unique corresponding record  $r'$  in some underlying db table, then **view is updatable**.

- In general;

- Single table views except those containing grouping are updatable.
- Multi-table views are NOT updatable.

DEPT	DId	DName
	10	compsci
	20	math
	30	drama

- create view StudentMajor as

```
select s.SName, d.DName
from STUDENT s, DEPT d
where s.MajorId=d.DId
```

STUDENT	SId	SName	GradYear	MajorId
	1	joe	2004	10
	2	amy	2004	20
	3	max	2005	10
	4	sue	2005	20
	5	bob	2003	30
	6	kim	2001	20
	7	art	2004	30
	8	pat	2001	20
	9	lee	2004	10

- Insert record {'joe', 'drama'}
  - Insert a new 'joe' record into STUDENT with having a MajorId=null. Insert a new 'drama' record into DEPT with having a DId= null.
  - Update 'joe's MajorId to 30
  - Insert a new 'joe' record into STUDENT with having a MajorId=10 ( *this is valid because SName is not key*)
- Delete record {'sue', 'math'}
  - Delete 'sue' record from STUDENT
  - Delete 'math' record from DEPT
  - Update 'MajorId' of 'sue'record in STUDENT
- Since db update via views is awkward, STORED PROCEDURES are more prevalent.
