# Path Planning

- Given
- a START pose,
- a desired GOAL pose,
- a geometric description of the ROBOT and
- a geometric description of the WORLD
- find a path that moves the robot gradually from start to goal.

# Configuration Space – Robot Arm

- Suppose a robot arm has  $k$  degrees of freedom
- Every state of the robot arm can be described with  $k$ -real values
- $K$ -values representing a point in the  $k$  dimensional space :  
configuration space

# Configuration Space – Robot Arm

# Configuration Space – Mobile Robot

- Assume robot is simply a point
- Each obstacle is inflated by the size of robots radius

# Path Planning

- Graph Search
  - Graph Construction
    - Visibility Graph
    - Voronoi Diagram
    - Exact Cell Decomposition
    - Approximate Cell Decomposition
  - Deterministic Graph Search
    - Breadth-First Search
    - Depth-First Search
    - Dijkstra's Algorithm
    - A\*
    - D\*
  - Randomized Graph Search
    - Rapidly Exploring Random Trees
- Potential Field Path Planning

# Visibility Graph

- Vertices of the graph are:
  - Start
  - Goal
  - Vertices of the obstacles visible from each other
- Visibility graphs are optimal in terms of path length

# Voronoi Diagram

- Maximize the distance between the robot and the obstacles
- Diagram points are equidistant from two or more obstacles

# Exact Cell Decomposition

- Cell boundaries are based geometric criticality
- In extremely sparse environments representation is efficient

# Approximate Cell Decomposition

- Approximate Cell Decomposition uses cells with the same simple pre defined shape in different scale

Quadtree decomposition

# Deterministic Graph Search

- Expected total cost :
- Path cost :
- Edge traversal cost :
- Heuristic cost :
- Can be defined for a node and an adjacent node

# Deterministic Graph Search

- ☾ Depth-First, Breadth-First
- AND ☾ Dijkstra's Algorithm
- ☾ Optimal  $A^*$
- ☾ Suboptimal  $A^*$

# Breadth-First Search

- Algorithm begins with the start node
- Explores all of its neighboring nodes
- Then, for each of these nodes, it explores all their unexplored neighbors and so on.
- This process goes as, marking a node “active”, exploring each of its neighbors and marking them “open”, and finally marking the parent node “visited
- The algorithm proceeds until it reaches the goal node where it terminates.

# Breadth-First Search

# Depth-First Search

- Depth-first search expands each node up to the deepest level of the graph
- May provide non optimal solutions
- May have better space complexity compared to breadth-first search

# Depth-First Search

# Dijkstra's Algorithm

- Similar to breadth-first search
- Edge costs may assume any positive value
- Guarantees solution optimality
- No heuristic is used
- Is a greedy algorithm yet produces an optimal solution

# Dijkstra's Algorithm

# A\*

- Similar to Dijkstra
- Includes an underestimated function of the cost to go
- Heuristic function is the distance from any node to goal

goal		g=1.4 h=2.0	g=1.0 h=3.0
			start
		g=1.4 h=2.8	g=1.0 h=3.8

g=4.8 goal h=0.0		g=1.4 h=2.0	g=1.0 h=3.0
g=3.8 h=1.0			start
g=3.4 h=2.0	g=2.4 h=2.4	g=1.4 h=2.8	g=1.0 h=3.8
g=3.8 h=3.0	g=2.8 h=3.4	g=2.4 h=3.8	g=2.8 h=4.2

goal			
			start

# D\*

- Incremental replanning version of A\*
- From start to goal A\* path is calculated
- If a change occurs, instead of calculating path from scratch, only effected states are recomputed

# Rapidly Exploring Random Trees

- Doesn't require graph decomposition
- Obstacle map is required
- RRTs grow a graph online during search
- Random nodes are generated and edges are grown from nearest nodes to randomly generated nodes
- Solution optimality is not guaranteed
- Deterministic completeness is not guaranteed

# Rapidly Exploring Random Trees

# Potential Field Path Planning

- Calculates a field/gradient across robot's map
- The goal acts as an attractive force
- Obstacles act as repulsive forces
- Superposition of repulsive and attractive forces is applied to robot
- Smoothly guides robot to goal, simultaneously avoiding obstacles

Gradient of potential field

# Potential Field Path Planning
