# Periodicity of DTFT

- For any integer m:  $X(e^{j\hat{\omega}}) = X(e^{j(\hat{\omega}+2m\pi)})$

$$\begin{aligned} X(e^{j(\hat{\omega}+2\pi)}) &= \sum_{n=-\infty}^{\infty} x[n] e^{-j(\hat{\omega}+2m\pi)n} \\ &= \sum_{n=-\infty}^{\infty} x[n] e^{-j\hat{\omega}n} e^{-j2\pi mn} = \sum_{n=-\infty}^{\infty} x[n] e^{-j\hat{\omega}n} \end{aligned}$$

- Discrete-time Fourier transform (DTFT) exists – provided that the sequence is **absolutely-summable**

$$\begin{aligned} |X(e^{j\hat{\omega}})| &= \left| \sum_{n=-\infty}^{\infty} x[n]e^{-j\hat{\omega}n} \right| \\ &\leq \sum_{n=-\infty}^{\infty} |x[n]e^{-j\hat{\omega}n}| = \sum_{n=-\infty}^{\infty} |x[n]| < \infty \end{aligned}$$

# DTFT maps Convolution to Multiplication

$$y[n] = \sum_{k=-\infty}^{\infty} h[k]x[n-k] \Leftrightarrow Y(e^{j\hat{\omega}}) = H(e^{j\hat{\omega}})X(e^{j\hat{\omega}})$$

# IDEAL LowPass Filter (LPF)

# Filtering with the IDEAL LPF

$$h[n] = \frac{\sin(\hat{\omega}_{co}n)}{\pi n} \stackrel{DTFT}{\Leftrightarrow} H(e^{j\hat{\omega}}) = \begin{cases} 1, & |\hat{\omega}| \leq \hat{\omega}_{co} \\ 0, & \hat{\omega}_{co} < |\hat{\omega}| \leq \pi \end{cases}$$

$$y[n] = h[n] * x[n] = \frac{\sin(\hat{\omega}_{co}n)}{\pi n} * \cos(\hat{\omega}_0 n) \quad ??$$

**Multiply** the spectrum of the input times the DTFT of the filter to get

$$y[n] = \begin{cases} \cos(\hat{\omega}_0 n) & \hat{\omega}_0 \leq \hat{\omega}_{co} \\ 0 & \hat{\omega}_0 > \hat{\omega}_{co} \end{cases}$$

# IDEAL HighPass Filter (HPF)

HPF is 1 minus LPF

is a delta

$$h_{HP}[n] = \delta[n] - \frac{\sin(\hat{\omega}_{co}n)}{\pi n} \quad \overset{DTFT}{\Leftrightarrow}$$

$$H_{HP}(e^{j\hat{\omega}}) = \begin{cases} 0, & |\hat{\omega}| \leq \hat{\omega}_{co} \\ 1, & \hat{\omega}_{co} < |\hat{\omega}| \leq \pi \end{cases}$$

# IDEAL BandPass Filter (BPF)

One in the passband  
Zero in the 2 stopbands

BPF has two stopbands

Band Reject Filter has  
one stopband and two  
passbands.  
It is one minus BPF

$$H_{BP}(e^{j\hat{\omega}}) = \begin{cases} 0 & |\hat{\omega}| \leq \hat{\omega}_{co1} \\ 1 & \hat{\omega}_{co1} < |\hat{\omega}| \leq \hat{\omega}_{co2} \\ 0 & \hat{\omega}_{co2} < |\hat{\omega}| \leq \pi \end{cases}$$

# Make IDEAL BPF from LPF

BPF is frequency shifted version of LPF

Frequency shifting **up and down** is done by cosine multiplication in the time domain

$$h_{BP}[n] = 2 \cos(\hat{\omega}_{mid} n) \frac{\sin(\frac{1}{2} \hat{\omega}_{diff} n)}{\pi n}$$
$$\stackrel{DTFT}{\Leftrightarrow} H_{BP}(e^{j\hat{\omega}}) = \begin{cases} 0 & |\hat{\omega}| \leq \hat{\omega}_{co1} \\ 1 & \hat{\omega}_{co1} < |\hat{\omega}| \leq \hat{\omega}_{co2} \\ 0 & \hat{\omega}_{co2} < |\hat{\omega}| \leq \pi \end{cases}$$

# Exercise-1

**EXERCISE 7.3:** Use the linearity of the DTFT and (7.6) to determine the DTFT of the following sum of two right-sided exponential signals:  $x[n] = (0.8)^n u[n] + 2(-0.5)^n u[n]$ .

Prentice Hall, Upper Saddle River, NJ 07458. ©2016 Pearson Education, Inc.

## SOLUTION to EXERCISE 7.3:

DSP First 2e

Equation (7.6) states in general

$$x[n] = a^n u[n] \longleftrightarrow X(e^{j\omega}) = \frac{1}{1 - ae^{-j\omega}}$$

Now if  $x[n] = (0.8)^n u[n] + 2(-0.5)^n u[n]$  we can use (7.6) with  $a = 0.8$  and  $-0.5$  and the linearity property to write down by inspection, the result

$$X(e^{j\omega}) = \frac{1}{1 - 0.8e^{-j\omega}} + \frac{2}{1 + 0.5e^{-j\omega}}$$

McClellan, Schafer, and Yoder, *DSP First, 2e*, ISBN 0-13-065562-7.  
Prentice Hall, Upper Saddle River, NJ 07458. ©2016 Pearson Education, Inc.

# Exercise-2

**EXERCISE 7.10:** Using the results of Exercise 7.9, show that the impulse response of the ideal HPF is

$$h_{\text{HP}}[n] = \delta[n] - \frac{\sin(\hat{\omega}_{co}n)}{\pi n}$$

**SOLUTION to EXERCISE 7.10:**

**DSP First 2e**

Given that  $H_{\text{HP}}(e^{j\hat{\omega}}) = 1 - H_{\text{LP}}(e^{j\hat{\omega}})$  we can use linearity of the DTFT to find  $h_{\text{HP}}[n]$ . We have the following DTFT pairs:

$$\begin{aligned} 1 &\longleftrightarrow \delta[n] \\ h_{\text{HP}}[n] = \frac{\sin(\hat{\omega}_{co}n)}{\pi n} &\longleftrightarrow H_{\text{LP}}(e^{j\hat{\omega}}) = \begin{cases} 1 & |\hat{\omega}| < \hat{\omega}_{co} \\ 0 & \hat{\omega}_{co} < |\hat{\omega}| \leq \pi \end{cases} \end{aligned}$$

Therefore,

$$h_{\text{HP}}[n] = \delta[n] - \frac{\sin(\hat{\omega}_{co}n)}{\pi n}$$

Prentice Hall, Upper Saddle River, NJ 07458. ©2016 Pearson Education, Inc.

# Exercise-3

**Example 7-1:** The following FIR filter

$$y[n] = 5x[n - 1] - 4x[n - 3] + 3x[n - 5]$$

has a finite-length impulse response:

$$h[n] = 5\delta[n - 1] - 4\delta[n - 3] + 3\delta[n - 5]$$

Each impulse in  $h[n]$  is transformed using (??), and then combined according to the linearity property of the DTFT which gives

$$H(e^{j\hat{\omega}}) = 5e^{-j\hat{\omega}} - 4e^{-j3\hat{\omega}} + 3e^{-j5\hat{\omega}}$$
