# **Introduction to Digital Logic**

Hamza Osman İLHAN

hoilhan@yildiz.edu.tr

#### **Course Outline**

- 1. Digital Computers, Number Systems, Arithmetic Operations, Decimal, Alphanumeric, and Gray Codes
- 2. Binary Logic, Gates, Boolean Algebra, Standard Forms
- 3. Circuit Optimization, Two-Level Optimization, Map Manipulation, Multi-Level Circuit Optimization
- 4. Additional Gates and Circuits, Other Gate Types, Exclusive-OR Operator and Gates, High-Impedance Outputs
- 5. Implementation Technology and Logic Design, Design Concepts and Automation, The Design Space, Design Procedure, The major design steps
- 6. Programmable Implementation Technologies: Read-Only Memories, Programmable Logic Arrays, Programmable Array Logic, Technology mapping to programmable logic devices
- 7. Combinational Functions and Circuits
- 8. Arithmetic Functions and Circuits
- 9. Sequential Circuits Storage Elements and Sequential Circuit Analysis
- 10. Sequential Circuits, Sequential Circuit Design State Diagrams, State Tables
- 11. Counters, register cells, buses, & serial operations
- 12. Sequencing and Control, Datapath and Control, Algorithmic State Machines (ASM)
- 13. Memory Basics

# **Introduction to Digital Logic**

#### Lecture 2

# Gate Circuits and Boolean Equations

- Binary Logic and Gates
  - Boolean Algebra
  - Standard Forms

## **Binary Logic and Gates**

- Binary variables take on one of two values.
- Logical operators operate on binary values and binary variables.
- Basic logical operators are the <u>logic functions</u> AND, OR and NOT.
- Logic gates implement logic functions.
- **Boolean Algebra**: a useful mathematical system for specifying and transforming logic functions.
- We study Boolean algebra as foundation for designing and analyzing digital systems!

## **Binary Variables**

- Recall that the two binary values have different names:
  - True/False
  - On/Off
  - Yes/No
  - -1/0
- We use 1 and 0 to denote the two values.
- Variable identifier examples:
  - -A, B, y, z, or  $X_1$  for now
  - RESET, START\_IT, or ADD1 later

## **Logical Operations**

- The three basic logical operations are:
  - -AND
  - OR
  - -NOT
- AND is denoted by a dot (·)
- OR is denoted by a plus (+)
- NOT is denoted by an overbar (¯), a single quote mark (') after, or (~) before the variable

## **Notation Examples**

#### • Examples:

- -Y=A.B is read "Y is equal to A AND B."
- z=x+y is read "z is equal to x OR y."
- $-X=\bar{A}$  is read "X is equal to NOT A."

#### Note: The statement:

```
1 + 1 = 2 (read "one <u>plus</u> one equals two")
is not the same as
```

1 + 1 = 1 (read "1 or 1 equals 1").

# **Operator Definitions**

Operations are defined on the values"0" and "1" for each operator:

AND	OR	NOT
$0 \cdot 0 = 0$	0+0=0	$\bar{0} = 1$
$0 \cdot 1 = 0$	0 + 1 = 1	$\overline{1} = 0$
$1 \cdot 0 = 0$	1 + 0 = 1	
$1 \cdot 1 = 1$	1 + 1 = 1	

#### **Truth Tables**

- Truth table a tabular listing of the values of a function for all possible combinations of values on its arguments
- Example: Truth tables for the basic logic operations:

AND			
X	Y	$Z = X \cdot Y$	
0	0	0	
0	1	0	
1	0	0	
1	1	1	

	OR		
X	Y	Z = X+Y	
0	0	0	
0	1	1	
1	0	1	
1	1	1	

NOT		
X	$Z = \overline{X}$	
0	1	
1	0	

## **Logic Function Implementation**

- Using Switches
  - For inputs:
    - logic 1 is switch closed
    - logic 0 is switch open
  - For outputs:
    - logic 1 is light on
    - logic 0 is <u>light off</u>.
  - NOT uses a switch such
    - that:
      - logic 1 is switch open
      - logic 0 is switch closed

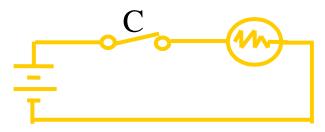

**Switches in parallel => OR** 

**Switches in series => AND** 

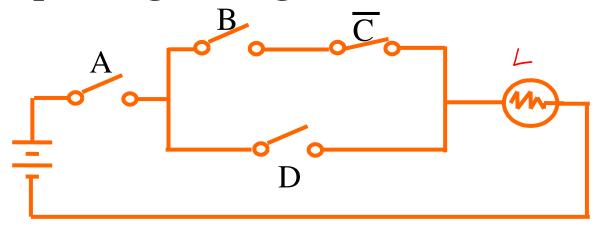

**Normally-closed switch => NOT** 

#### Logic Function Implementation (Continued)

Example: Logic Using Switches

• Light is on (L = 1) for

$$L(A, B, C, D) = A \cdot ((B \cdot C')+D)$$
  
and off  $(L = 0)$ , otherwise.

 Useful model for relay circuits and for CMOS gate circuits, the foundation of current digital logic technology

## **Logic Gates**

- In the earliest computers, switches were opened and closed by magnetic fields produced by energizing coils in *relays*. The switches in turn opened and closed the current paths.
- Later, *vacuum tubes* that open and close current paths electronically replaced relays.
- Today, *transistors* are used as electronic switches that open and close current paths.

## Logic Gates (continued)

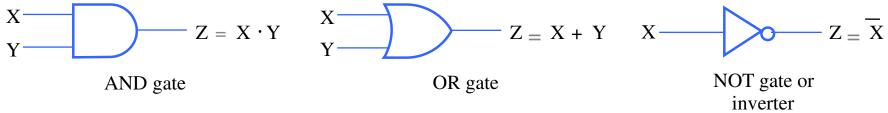

• Implementation of logic gates with transistors (See Reading Supplement – CMOS Circuits)

- Transistor or tube implementations of logic functions are called <u>logic gates</u> or just <u>gates</u>
- Transistor gate circuits can be modeled by switch circuits

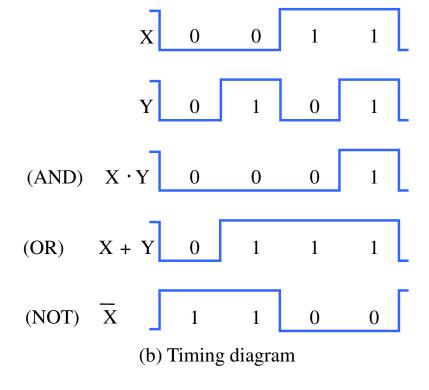

## Logic Gate Symbols and Behavior

Logic gates have special symbols:

(a) Graphic symbols

And waveform behavior in time as follows:

## Logic Diagrams and Expressions

	<b>4</b> T.		1 .
Iru	th	<b>Tab</b>	P
11 4		IUI)	L

Truth Table			
XYZ	$ \mathbf{F} = \mathbf{X} + \overline{\mathbf{Y}} \cdot \mathbf{Z} $		
000	0		
001	1		
010	0		
011	0		
100	1		
101	1		
110	1		
111	1		

#### **Equation**

$$F = X + \overline{Y} Z$$

**Logic Diagram** 

- Boolean equations, truth tables and logic diagrams describe the same function!
- Truth tables are unique; expressions and logic diagrams are not. This gives flexibility in implementing functions.

## Boolean Algebra

■ An algebraic structure defined on a set of at least two elements, B, together with three binary operators (denoted +, · and —) that satisfies the following basic identities:

Existence of 0 and1	$X \cdot 1 = X$	2.	X + 0 = X	1.
Existerice of 0 and 1	$X \cdot 0 = 0$	4.	X + 1 = 1	3.
Idempotence	$X \cdot X = X$	6.	X + X = X	5.
<b>Existence of complement</b>	$X \cdot \overline{X} = 0$	8.	$X + \overline{X} = 1$	7.
Involution			$\overline{\overline{X}} = X$	9.
Commutative	XY = YX	11.	X + Y = Y + X	10.
(Z) Associative	(XY)Z = X(	13.	(X+Y)+Z=X+(Y+Z)	12.
(X + Y)(X + Z) Distributive	$X + YZ = (X - YZ)^T + (X - YZ$	15.	X(Y+Z) = XY + XZ	14.
DeMorgan's	$\overline{X \cdot Y} = \overline{X} +$	17.	$\overline{X+Y} = \overline{X} \cdot \overline{Y}$	16.

#### **Boolean Operator Precedence**

- The order of evaluation in a Boolean expression is:
  - 1. Parentheses
  - 2. NOT
  - 3. AND
  - 4. OR
- Consequence: Parentheses appear around OR expressions
- Example: F = A(B + C)(C + D)

# Example 1: Boolean Algebraic Proof

• 
$$A + A \cdot B = A$$
 (Absorption Theorem)

Proof Steps
 $A + A \cdot B$ 
 $A +$ 

- Our primary reason for doing proofs is to learn:
  - Careful and efficient use of the identities and theorems of Boolean algebra, and
  - How to choose the appropriate identity or theorem to apply to make forward progress, irrespective of the application.

## Example 2: Boolean Algebraic Proofs

• 
$$AB + \overline{A}C + BC = AB + \overline{A}C$$
 (Consensus Theorem)  
Proof Steps: Justification (identity or theorem)  
 $AB + \overline{A}C + BC$   
 $= AB + \overline{A}C + 1 \cdot BC$   
 $= AB + \overline{A}C + (A + \overline{A}) \cdot BC$   
 $= AB + \overline{A}C + ABC + \overline{A}BC$   
 $= AB (1+C) + \overline{A}C (1+B)$   
 $= AB \cdot 1 + \overline{A}C \cdot 1$   
 $= AB + \overline{A}C$ 

# **Example 3: Boolean Algebraic Proofs**

• 
$$(\overline{X} + \overline{Y})Z + X\overline{Y} = \overline{Y}(X + Z)$$
  
Proof Steps Justification (identity or theorem)  
 $(\overline{X} + \overline{Y})Z + X\overline{Y}$ 

#### **Useful Theorems**

$$x \cdot y + \overline{x} \cdot y = y$$
  $(x + y)(\overline{x} + y) = y$  Minimization  
 $x + x \cdot y = x$   $x \cdot (x + y) = x$  Absorption  
 $x + \overline{x} \cdot y = x + y$   $x \cdot (\overline{x} + y) = x \cdot y$  Simplification  
 $x \cdot y + \overline{x} \cdot z + y \cdot z = x \cdot y + \overline{x} \cdot z$  Consensus  
 $(x + y) \cdot (\overline{x} + z) \cdot (y + z) = (x + y) \cdot (\overline{x} + z)$   
 $\overline{x + y} = \overline{x} \cdot \overline{y}$   $\overline{x \cdot y} = \overline{x} + \overline{y}$  DeMorgan's Laws

## **Proof of Simplification**

$$\mathbf{x} \cdot \mathbf{y} + \overline{\mathbf{x}} \cdot \mathbf{y} = \mathbf{y}$$

$$(x + y)(\overline{x} + y) = y$$

## Proof of DeMorgan's Laws

$$\overline{\mathbf{x} + \mathbf{y}} = \overline{\mathbf{x}} \cdot \overline{\mathbf{y}}$$

$$\overline{\mathbf{x} \cdot \mathbf{y}} = \overline{\mathbf{x}} + \overline{\mathbf{y}}$$

#### **Boolean Function Evaluation**

F1 = 
$$xy\overline{z}$$
  
F2 =  $x + \overline{y}z$   
F3 =  $\overline{x}\overline{y}\overline{z} + \overline{x}yz + x\overline{y}$   
F4 =  $x\overline{y} + \overline{x}z$ 

X	y	Z	<b>F</b> 1	F2	F3	F4
0	0	0	0	0	1	0
0	0	1	0	1	0	1
0	1	0	0	0	0	0
0	1	1	0	0	1	1
1	0	0	0	1	1	1
1	0	1	0	1	1	1
1	1	0	1	1	0	0
1	1	1	0	1	0	0

## **Expression Simplification**

- An application of Boolean algebra
- Simplify to contain the smallest number of <u>literals</u> (complemented and uncomplemented variables):

$$AB + \overline{A}CD + \overline{A}BD + \overline{A}C\overline{D} + ABCD$$

$$= AB + ABCD + \overline{A}CD + \overline{A}CD + \overline{A}BD$$

$$= AB + AB(CD) + \overline{A}C(D + \overline{D}) + \overline{A}BD$$

$$= AB + \overline{A}C + \overline{A}BD = B(A + \overline{A}D) + \overline{A}C$$

$$= B(A + D) + \overline{A}C = 5 \text{ literals}$$

## **Complementing Functions**

- Use DeMorgan's Theorem to complement a function:
  - 1. Interchange AND and OR operators
  - 2. Complement each constant value and literal
- Example: Complement  $F = \overline{x}y\overline{z} + x\overline{y}\overline{z}$  $\overline{F} = (x + \overline{y} + z)(\overline{x} + y + z)$
- Example: Complement  $G = (\overline{a} + bc)\overline{d} + e$  $\overline{G} = ?$

#### Overview – Canonical Forms

- What are Canonical Forms?
- Minterms and Maxterms
- Index Representation of Minterms and Maxterms
- Sum-of-Minterm (SOM) Representations
- Product-of-Maxterm (POM) Representations
- Representation of Complements of Functions
- Conversions between Representations

#### **Canonical Forms**

- It is useful to specify Boolean functions in a form that:
  - Allows comparison for equality.
  - Has a correspondence to the truth tables
- Canonical Forms in common usage:
  - Sum of Minterms (SOM)
  - Product of Maxterms (POM)

#### **Minterms**

- <u>Minterms</u> are AND terms with every variable present in either true or complemented form.
- Given that each binary variable may appear normal (e.g., x) or complemented (e.g.,  $\overline{x}$ ), there are  $2^n$  minterms for n variables.
- Example: Two variables (X and Y)produce  $2 \times 2 = 4$  combinations:

```
XY (both normal)
XY (X normal, Y complemented)
XY (X complemented, Y normal)
```

**XY** (both complemented)

• Thus there are four minterms of two variables.

#### **Maxterms**

- <u>Maxterms</u> are OR terms with every variable in true or complemented form.
- Given that each binary variable may appear normal (e.g., x) or complemented (e.g.,  $\overline{x}$ ), there are  $2^n$  maxterms for n variables.
- Example: Two variables (X and Y) produce  $2 \times 2 = 4$  combinations:

```
    X+Y
    X+Y
    X+Y
    X+Y
    X+Y
    X+Y
    X+Y
    X+Y
    X+Y
    (both complemented)
```

#### **Maxterms and Minterms**

• Examples: Two variable minterms and maxterms.

Index	Minterm	Maxterm
0	$\overline{\mathbf{x}}\overline{\mathbf{y}}$	x + y
1	$\overline{\mathbf{x}} \mathbf{y}$	$x + \overline{y}$
2	х ӯ	$\overline{\mathbf{x}} + \mathbf{y}$
3	ху	$\overline{x} + \overline{y}$

• The index above is important for describing which variables in the terms are true and which are complemented.

#### **Standard Order**

- Minterms and maxterms are designated with a subscript
- The subscript is a number, corresponding to a binary pattern
- The bits in the pattern represent the complemented or normal state of each variable listed in a standard order.
- All variables will be present in a minterm or maxterm and will be listed in the <u>same order</u> (usually alphabetically)
- Example: For variables a, b, c:
  - Maxterms:  $(a + b + \overline{c})$ , (a + b + c)
  - Terms: (b + a + c), a c̄ b, and (c + b + a) are NOT in standard order.
  - Minterms:  $a \bar{b} c$ , a b c,  $\bar{a} \bar{b} c$
  - Terms: (a + c),  $\bar{b}$  c, and  $(\bar{a} + b)$  do not contain all variables

#### **Purpose of the Index**

• The <u>index</u> for the minterm or maxterm, expressed as a binary number, is used to determine whether the variable is shown in the true form or complemented form.

#### • For Minterms:

- "1" means the variable is "Not Complemented" and
- "0" means the variable is "Complemented".

#### For Maxterms:

- "0" means the variable is "Not Complemented" and
- "1" means the variable is "Complemented".

## **Index Example in Three Variables**

- Example: (for three variables)
- Assume the variables are called X, Y, and Z.
- The standard order is X, then Y, then Z.
- The Index 0 (base 10) = 000 (base 2) for three variables). All three variables are complemented for minterm 0 ( $\overline{X}, \overline{Y}, \overline{Z}$ ) and no variables are complemented for Maxterm 0 (X, Y, Z).
  - Minterm 0, called  $m_0$  is  $\overline{X}\overline{Y}\overline{Z}$ .
  - Maxterm 0, called  $M_0$  is (X + Y + Z).
  - Minterm 6?
  - Maxterm 6 ?

## **Index Examples – Four Variables**

#### **Index Binary Minterm Maxterm**

i	Pattern	$\mathbf{m_{i}}$	$\mathbf{M_i}$
0	0000	abcd	a+b+c+d
1	0001	abcd	?
3	0011	?	$a+b+\bar{c}+\bar{d}$
5	0101	abcd	$a+\overline{b}+c+\overline{d}$
7	0111	?	$a+\overline{b}+\overline{c}+\overline{d}$
<b>10</b>	1010	abcd	$\bar{a} + b + \bar{c} + d$
13	1101	abcd	?
15	1111	abcd	$\bar{a} + \bar{b} + \bar{c} + \bar{d}$

## Minterm and Maxterm Relationship

- Review: DeMorgan's Theorem  $\overline{x \cdot y} = \overline{x} + \overline{y}$  and  $\overline{x + y} = \overline{x} \cdot \overline{y}$
- Two-variable example:

$$\mathbf{M}_2 = \overline{\mathbf{x}} + \mathbf{y}$$
 and  $\mathbf{m}_2 = \mathbf{x} \cdot \overline{\mathbf{y}}$ 

Thus  $M_2$  is the complement of  $m_2$  and vice-versa.

- Since DeMorgan's Theorem holds for *n* variables, the above holds for terms of *n* variables
- giving:

$$M_i = \overline{M}_{i \text{ and } m_i} = \overline{M}_{i}$$

Thus M<sub>i</sub> is the complement of m<sub>i</sub>.

#### **Function Tables for Both**

Minterms of 2 variables

x y	$m_0$	$\mathbf{m}_1$	$m_2$	$m_3$
0 0	1	0	0	0
01	0	1	0	0
10	0	0	1	0
11	0	0	0	1

Maxterms of 2 variables

ху	$\mathbf{M_0}$	$M_1$	$M_2$	$M_3$
0 0	0	1	1	1
01	1	0	1	1
10	1	1	0	1
11	1	1	1	0

• Each column in the maxterm function table is the complement of the column in the minterm function table since  $M_i$  is the complement of  $m_i$ .

#### **Observations**

- In the function tables:
  - Each minterm has one and only one 1 present in the  $2^n$  terms (a minimum of 1s). All other entries are 0.
  - Each <u>max</u>term has one and only one 0 present in the  $2^n$  terms All other entries are 1 (a <u>max</u>imum of 1s).
- We can implement any function by "ORing" the minterms corresponding to "1" entries in the function table. These are called the minterms of the function.
- We can implement any function by "ANDing" the maxterms corresponding to "0" entries in the function table. These are called the maxterms of the function.
- This gives us two <u>canonical forms</u>:
  - Sum of Minterms (SOM)
  - Product of Maxterms (POM)

for stating any Boolean function.

## Minterm Function Example

- Example: Find  $F_1 = m_1 + m_4 + m_7$
- $\mathbf{F1} = \overline{\mathbf{x}} \ \overline{\mathbf{y}} \ \mathbf{z} + \mathbf{x} \ \overline{\mathbf{y}} \ \overline{\mathbf{z}} + \mathbf{x} \ \mathbf{y} \ \mathbf{z}$

хуz	index	$\mathbf{m}_1$	+	m <sub>4</sub>	+	<b>m</b> <sub>7</sub>	$=\mathbf{F}_1$
000	0	0	+	0	+	0	= 0
001	1	1	+	0	+	0	= 1
010	2	0	+	0	+	0	= 0
011	3	0	+	0	+	0	= 0
100	4	0	+	1	+	0	= 1
101	5	0	+	0	+	0	= 0
110	6	0	+	0	+	0	= 0
111	7	0	+	0	+	1	= 1

## **Minterm Function Example**

- $F(A, B, C, D, E) = m_2 + m_9 + m_{17} + m_{23}$
- F(A, B, C, D, E) =

### **Maxterm Function Example**

• Example: Implement F1 in maxterms:

$$F_1 = M_0 \cdot M_2 \cdot M_3 \cdot M_5 \cdot M_6$$

$$F_1 = (x + y + z) \cdot (x + \overline{y} + z) \cdot (x + \overline{y} + \overline{z})$$

$$\cdot (\overline{x} + y + \overline{z}) \cdot (\overline{x} + \overline{y} + z)$$

хуz	i	$\mathbf{M}_0 \cdot \mathbf{M}_2 \cdot \mathbf{M}_3 \cdot \mathbf{M}_5 \cdot \mathbf{M}_6 = \mathbf{F}1$
$0\ 0\ 0$	0	$\begin{array}{cccccccccccccccccccccccccccccccccccc$
001	1	$1 \cdot 1 \cdot 1 \cdot 1 \cdot 1 = 1$
010	2	$\begin{array}{cccccccccccccccccccccccccccccccccccc$
011	3	$\begin{array}{cccccccccccccccccccccccccccccccccccc$
100	4	$1 \cdot 1 \cdot 1 \cdot 1 \cdot 1 = 1$
101	5	$\begin{array}{cccccccccccccccccccccccccccccccccccc$
110	6	$\begin{array}{cccccccccccccccccccccccccccccccccccc$
111	7	$\begin{array}{ c c c c c c c c c c c c c c c c c c c$

## **Maxterm Function Example**

- $F(A,B,C,D) = M_3 \cdot M_8 \cdot M_{11} \cdot M_{14}$
- F(A, B,C,D) =

#### **Canonical Sum of Minterms**

- Any Boolean function can be expressed as a **Sum of Minterms**.
  - For the function table, the <u>minterms</u> used are the terms corresponding to the 1's
  - For expressions, <u>expand</u> all terms first to explicitly list all minterms. Do this by "ANDing" any term missing a variable v with a term  $(\mathbf{v} + \overline{\mathbf{v}})$ .
- Example: Implement  $f = x + \overline{x} \overline{y}$  as a sum of minterms.

First expand terms:  $f = x(y + \overline{y}) + \overline{x} \overline{y}$ Then distribute terms:  $f = xy + x\overline{y} + \overline{x} \overline{y}$ Express as sum of minterms:  $f = m_3 + m_2 + m_0$ 

# **Another SOM Example**

- Example:  $F = A + \overline{B} C$
- There are three variables, A, B, and C which we take to be the standard order.
- Expanding the terms with missing variables:

- Collect terms (removing all but one of duplicate terms):
- Express as SOM:

### **Shorthand SOM Form**

• From the previous example, we started with:

$$F = A + \overline{B} C$$

• We ended up with:

$$F = m_1 + m_4 + m_5 + m_6 + m_7$$

- This can be denoted in the formal shorthand:  $F(A,B,C) = \Sigma_m(1,4,5,6,7)$
- Note that we explicitly show the standard variables in order and drop the "m" designators.

#### **Canonical Product of Maxterms**

- Any Boolean Function can be expressed as a <u>Product of Maxterns (POM)</u>.
  - For the function table, the maxterms used are the terms corresponding to the 0's.
  - For an expression, expand all terms first to explicitly list all maxterms. Do this by first applying the second distributive law, "ORing" terms missing variable V with a term equal to  $V \cdot \overline{V}$  and then applying the distributive law again.
- Example: Convert to product of maxterms:

$$f(x,y,z) = x + \overline{x} \, \overline{y}$$

Apply the distributive law:

$$x + \overline{x} \overline{y} = (x + \overline{x})(x + \overline{y}) = 1 \cdot (x + \overline{y}) = x + \overline{y}$$

Add missing variable z:

$$x + \overline{y} + z \cdot \overline{z} = (x + \overline{y} + z)(x + \overline{y} + \overline{z})$$

Express as POM:  $f = M_2 \cdot M_3$ 

## **Another POM Example**

Convert to Product of Maxterms:

$$f(A,B,C) = A \overline{C} + BC + \overline{A} \overline{B}$$

• Use  $x + y = (x+y) \cdot (x+z)$  with  $x = (A \overline{C} + B C)$ ,  $y = \overline{A}$ , and  $z = \overline{B}$  to get:

$$f = (A \overline{C} + B C + \overline{A})(A \overline{C} + B C + \overline{B})$$

• Then use  $x + \overline{x}y = x + y$  to get:

$$f = (\overline{C} + BC + \overline{A})(A\overline{C} + C + \overline{B})$$

and a second time to get:

$$f = (\overline{C} + B + \overline{A})(A + C + \overline{B})$$

Rearrange to standard order,

$$f = (\overline{A} + B + \overline{C})(A + \overline{B} + C)$$
 to give  $f = M_5 \cdot M_2$ 

## **Function Complements**

- The complement of a function expressed as a sum of minterms is constructed by selecting the minterms missing in the sum-of-minterms canonical forms.
- Alternatively, the complement of a function expressed by a Sum of Minterms form is simply the Product of Maxterms with the same indices.
- Example: Given  $F(x, y, z) = \Sigma_m(1,3,5,7)$   $\overline{F}(x, y, z) = \Sigma_m(0,2,4,6)$  $\overline{F}(x, y, z) = \Pi_M(1,3,5,7)$

#### **Conversion Between Forms**

- To convert between sum-of-minterms and productof-maxterms form (or vice-versa) we follow these steps:
  - Find the function complement by swapping terms in the list with terms not in the list.
  - Change from products to sums, or vice versa.
- Example: Given F as before:  $F(x, y, z) = \sum_{m} (1, 3, 5, 7)$
- Form the Complement:  $\overline{F}(x,y,z) = \Sigma_m(0,2,4,6)$
- Then use the other form with the same indices this forms the complement again, giving the other form of the original function:  $F(x,y,z) = \Pi_M(0,2,4,6)$

### **Standard Forms**

- <u>Standard Sum-of-Products (SOP) form:</u> equations are written as an OR of AND terms
- <u>Standard Product-of-Sums (POS) form:</u> equations are written as an AND of OR terms
- Examples:
  - SOP:  $A B C + \overline{A} \overline{B} C + B$
  - POS:  $(A+B)\cdot (A+\overline{B}+\overline{C})\cdot C$
- These "mixed" forms are neither SOP nor POS
  - -(A B + C) (A + C)
  - -ABC+AC(A+B)

## Standard Sum-of-Products (SOP)

- A sum of minterms form for *n* variables can be written down directly from a truth table.
  - Implementation of this form is a two-level network of gates such that:
  - The first level consists of *n*-input AND gates,
     and
  - The second level is a single OR gate (with fewer than  $2^n$  inputs).
- This form often can be simplified so that the corresponding circuit is simpler.

## Standard Sum-of-Products (SOP)

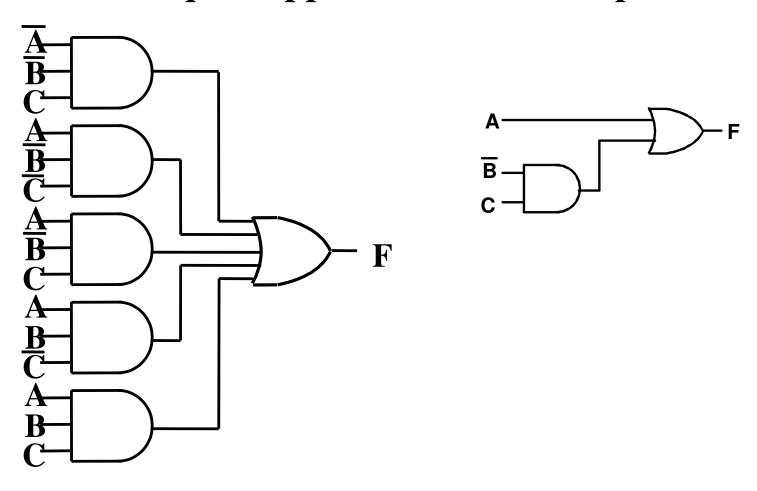

- A Simplification Example:
- $F(A,B,C) = \Sigma m(1,4,5,6,7)$
- Writing the minterm expression:  $F = \overline{A} \overline{B} C + A \overline{B} \overline{C} + A \overline{B} C + A \overline{B} C + A \overline{B} C$
- Simplifying:

$$F = A + \overline{B}C$$

• Simplified F contains 3 literals compared to 15 in minterm F

#### **AND/OR Two-level Implementation of SOP Expression**

• The two implementations for F are shown below – it is quite apparent which is simpler!

#### • The previous examples show that:

- Canonical Forms (Sum-of-minterms, Product-of-Maxterms), or other standard forms (SOP, POS) differ in complexity
- Boolean algebra can be used to manipulate equations into simpler forms.
- Simpler equations lead to simpler two-level implementations

#### • Questions:

- How can we attain a "simplest" expression?
- Is there only one minimum cost circuit?
- The next part will deal with these issues.
